EPL: what we have implemented

An end-to-end research system for match probabilities, archived-price trading and prospective evaluation.

DATA

20 current clubs

Team, xG and player histories

PREDICTION

19 model series

16 learned predictors + 3 benchmarks

TRADING

116 accounts

Each starts at 100,000 in 2025/26

What is already built

Source captures and identity checks
Strictly lagged team and player features
Chronological fitting and calibration

Trading, cash and risk accounting
Complete money curves and strategy catalog
Timestamped forecasts, audits and reports

Presentation: 21 October 2026 | Completed evidence through the 20 October snapshot | EPL component

Sources: study_status.json; prospective_status.json | Full paths in notes

The data behind the implemented system

Current-club scope; full historical opponents remain context. Snapshot completed matches run through 19 October 2026.

HISTORICAL PLAYER RECORDS

253,509

Player-match rows, 2016/17–2025/26

CURRENT PLAYER HISTORY

4,551

Rows from 70 completed fixtures

CURRENT PLAYER SUMMARIES

668

Full FPL snapshot, 20 October

Source block	Implemented use	Timing boundary
Football-Data + bookmaker panel	Results, team form, individual-book prices	Strictly earlier features; quote clocks unverified
Understat	Team expected-goals history	Earlier completed games
FPL archives + current FPL	Player form, squad profiles and projected XI	Earlier same-season fixture slots only

Other acquired sources are preserved in the data inventory; this deck describes the inputs actually used in the models.

Sources: study_status.json; model_catalog.json; prospective_status.json | Full paths in notes

A prediction model is one part of a strategy

The account graph combines model + outcome rule + prices + sizing; it does not compare algorithms in isolation.

1 Lagged inputs

Team form
xG
Player histories

2 H / D / A

Regularized models
Separate calibration
Saved probabilities

3 Trading rule

Outcome and edge
Price panel
Stake request

4 Account replay

Date-start cash
Joint allocation
Settlement and risk

Model quality ≠ strategy profitability

Accuracy and probability loss score forecasts. Hit ratio and money depend on the bets, prices and stake sizes actually replayed.

Sources: all_strategy_catalog.json; metrics.py | Full paths in notes

A chronological comparison on the same fixtures

1,470 quoted matches in four evaluation seasons. Historical redesigns remain exploratory.

Evaluate	Initial training	Tune, then include in refit	Calibrate	Matches
2022/23	2016/17–2019/20	2020/21	2021/22	368
2023/24	2016/17–2020/21	2021/22	2022/23	360
2024/25	2016/17–2021/22	2022/23	2023/24	368
2025/26	2016/17–2022/23	2023/24	2024/25	374

Fit preprocessing only on permitted fitting data. Freeze coefficients and calibration within each evaluation season.

Every comparable model sees the same evaluation fixtures. Earlier games may update later lagged inputs.

Repeatedly inspected history is not a new untouched test. The current-club cohort also creates selection limitations.

The strongest learned predictor still trails the market

Observed pooled probability scores on the same 1,470 fixtures; lower log loss and Brier are better.

Predictor	Accuracy	Log loss	Brier	ECE 10
Raw Bet365 market benchmark	54.42%	0.9662	0.5743	1.77%
Best learned: market residual + team/FPL	54.15%	0.9693	0.5751	2.16%
Team logistic regression	52.93%	0.9876	0.5889	2.17%
Player-form logistic regression	50.07%	1.0218	0.6114	3.45%
Class-frequency baseline	44.29%	1.0700	0.6471	1.53%

Best learned = market residual with team data and seven FPL aggregates.

It uses bookmaker probabilities as an input. Its small historical changes do not establish incremental value over the market.

Sources: predictions.parquet; model_metrics_pooled.parquet | Full paths in notes

MODEL PROFILE | SAME 1,470 FIXTURES

Best learned predictor: market residual + team/FPL

28 historical inputs + bookmaker-probability offset; regularized home/draw adjustments, then temperature calibration.

Classification accuracy

54.15%

1,470 common fixtures

Log loss | lower is better

0.9693

1,470 common fixtures

Brier score | lower is better

0.5751

1,470 common fixtures

Classwise ECE | 10 bins

2.16%

1,470 common fixtures

WHAT THE MODEL DOES

Start from normalized inverse Bet365 odds.
Learn regularized adjustments from team form and seven rolling FPL aggregates.
Keep training, tuning and calibration chronological.

TRADING WRAPPER S029 | CONTINUOUS FOUR SEASONS

Trading statistic	Recorded result
Ending account	123,340
Return on starting 100K	23.34%
Hit ratio / trade frequency	31.04% / 78.03%
ROI on total stakes	2.03%
Maximum drawdown	31.88%

The raw market has lower pooled log loss (0.9662). S029's positive archived return is not proof of a validated predictive edge.

Sources: predictions.parquet; metrics_continuous.parquet | Full paths in notes

Simplest model: historical class frequencies

No match features, team identity or odds input. The same three probabilities are used for every match within an outer season.

Classification accuracy

44.29%

1,470 common fixtures

Log loss | lower is better

1.0700

1,470 common fixtures

Brier score | lower is better

0.6471

1,470 common fixtures

Classwise ECE | 10 bins

1.53%

1,470 common fixtures

WHAT THE MODEL DOES

Count home wins, draws and away wins in the fitting block. Use those fractions as the forecast.
2025/26 probabilities:
H 45.58% D 22.11% A 32.31%

TRADING WRAPPER S033 | CONTINUOUS FOUR SEASONS

Trading statistic	Recorded result
Ending account	29,760
Return on starting 100K	-70.24%
Hit ratio / trade frequency	23.01% / 98.44%
ROI on total stakes	-4.85%
Maximum drawdown	89.49%

Low ECE alone does not imply useful match discrimination. S033 applies an edge rule to these probabilities; it is not an always-home policy.

Sources: predictions.parquet; metrics_continuous.parquet | Full paths in notes

MODEL PROFILE | SAME 1,470 FIXTURES

Team-data model: regularized logistic regression

21 inputs: nine team-performance measures, four context flags and eight shared source-coverage controls.

Classification accuracy

52.93%

1,470 common fixtures

Log loss | lower is better

0.9876

1,470 common fixtures

Brier score | lower is better

0.5889

1,470 common fixtures

Classwise ECE | 10 bins

2.17%

1,470 common fixtures

WHAT THE MODEL DOES

Use earlier goals, shots on target, corners, points, rest and prior-season win rates.
Median imputation, indicators and scaling are fitted in the permitted block.
No player-performance or odds predictors.

TRADING WRAPPER S017 | CONTINUOUS FOUR SEASONS

Trading statistic	Recorded result
Ending account	119,790
Return on starting 100K	19.79%
Hit ratio / trade frequency	29.57% / 84.42%
ROI on total stakes	1.59%
Maximum drawdown	40.35%

S017 has a positive historical capital return, with a 40.35% drawdown. The probability model still trails the raw market benchmark.

Sources: predictions.parquet; metrics_continuous.parquet | Full paths in notes

MODEL PROFILE | SAME 1,470 FIXTURES

Player-only model: recent FPL form

96 inputs: 90 player-performance aggregates and six coverage controls. No team-strength, position or odds predictors.

Classification accuracy

50.07%

1,470 common fixtures

Log loss | lower is better

1.0218

1,470 common fixtures

Brier score | lower is better

0.6114

1,470 common fixtures

Classwise ECE | 10 bins

3.45%

1,470 common fixtures

WHAT THE MODEL DOES

Aggregate 12 FPL measures plus player/minute counts over the previous 5 and 10 fixture slots.
Represent home, away and their differences.
Missing history remains visible; target appearances are excluded.

TRADING WRAPPER P009 | CONTINUOUS FOUR SEASONS

Trading statistic	Recorded result
Ending account	0
Return on starting 100K	-100.00%
Hit ratio / trade frequency	25.00% / 64.22%
ROI on total stakes	-10.87%
Maximum drawdown	100.00%

The matched team-control log loss is 0.9925 versus 1.0218 here. P009 exhausts its four-season cash; that path includes no borrowing.

Sources: model_metrics_pooled.csv; metrics_continuous.parquet | Full paths in notes

Richer player features did not improve these models

Four fixed feature groups, each crossed with logistic regression and histogram gradient boosting.

Feature group	Inputs	Logistic log loss	Boosting log loss
Matched team control	19	0.9925	0.9987
Player form	96	1.0218	1.0287
Player form + XI + depth	222	1.0254	1.0234
Team + full player block	235	1.0161	1.0158

POOLED COMPARISON

0 / 6 improve

Player-based variants vs matched controls

NEW STRATEGY STUDY

0 / 32 profitable

Continuous four-season accounts

CASH EXHAUSTION

11 / 32

New accounts reach zero

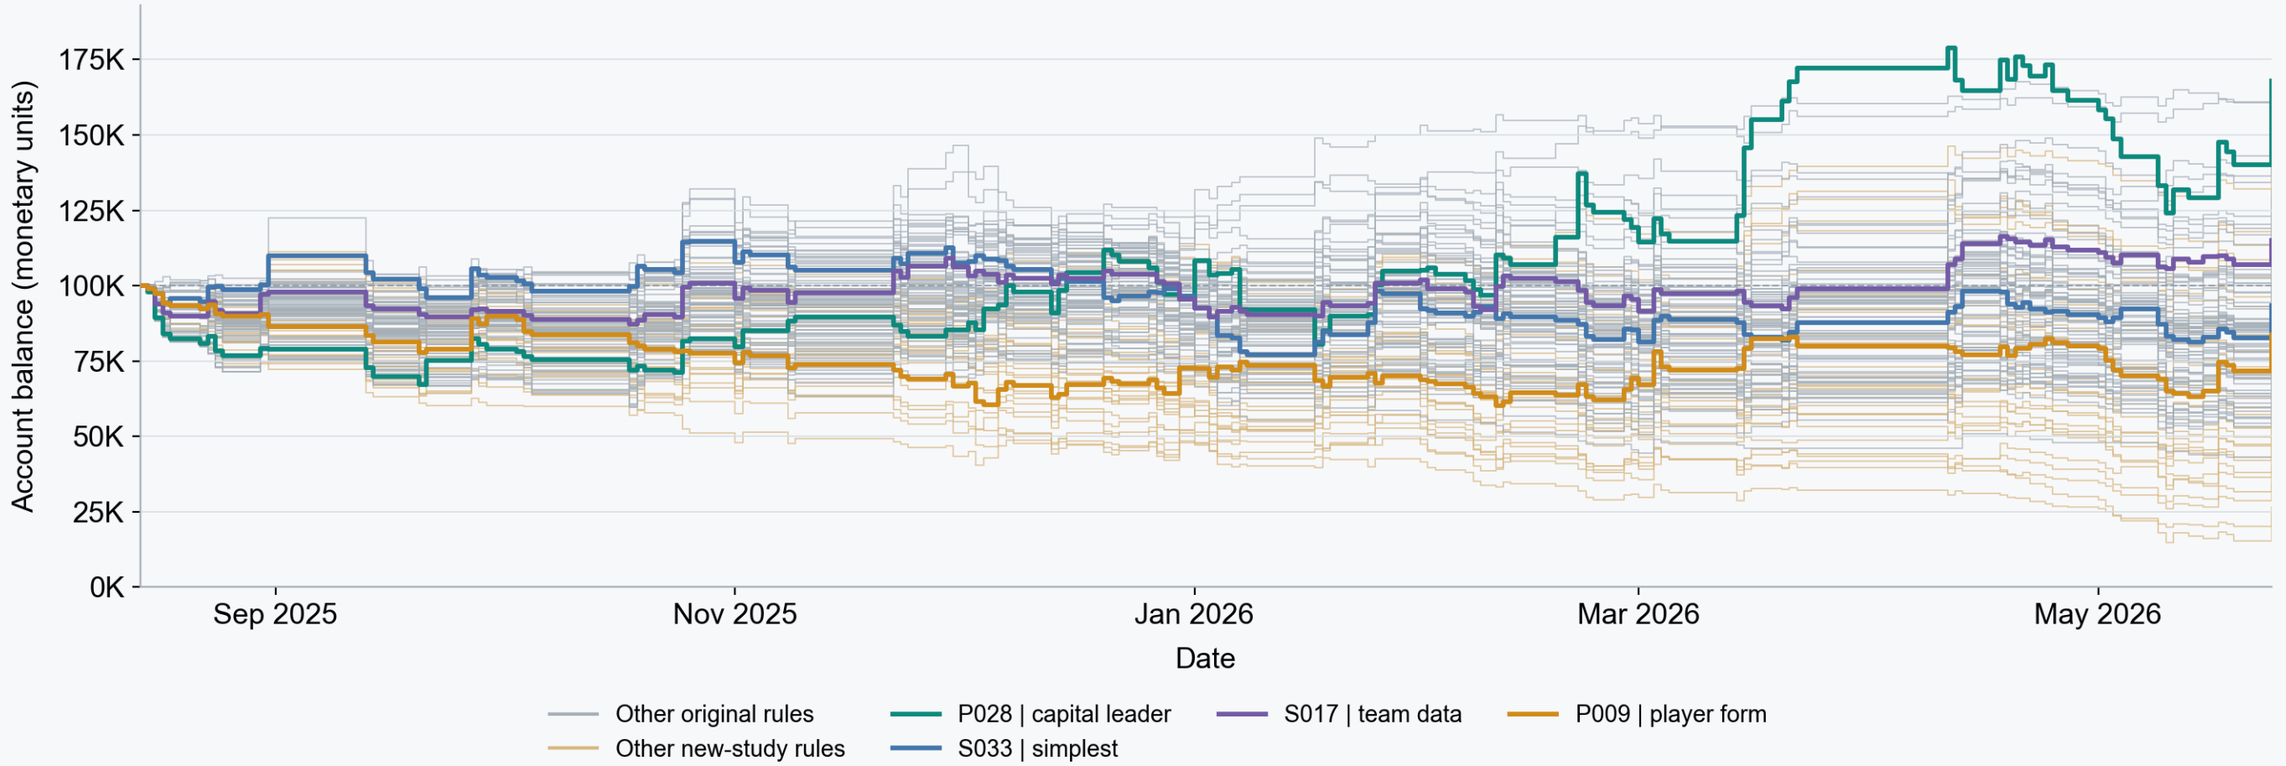

Projected XI is a past-minute proxy, not a confirmed lineup or availability feed.
Some archived position proxies have unverified publication times.

Money progression: all 116 strategy accounts

2025/26 | Same 374 quoted fixtures | Every account begins at 100,000

33 profitable / 75 losing / 8 flat/cash / 0 reach zero

All 84 original rules and all 32 new rules are included. Coincident cash paths overlap.

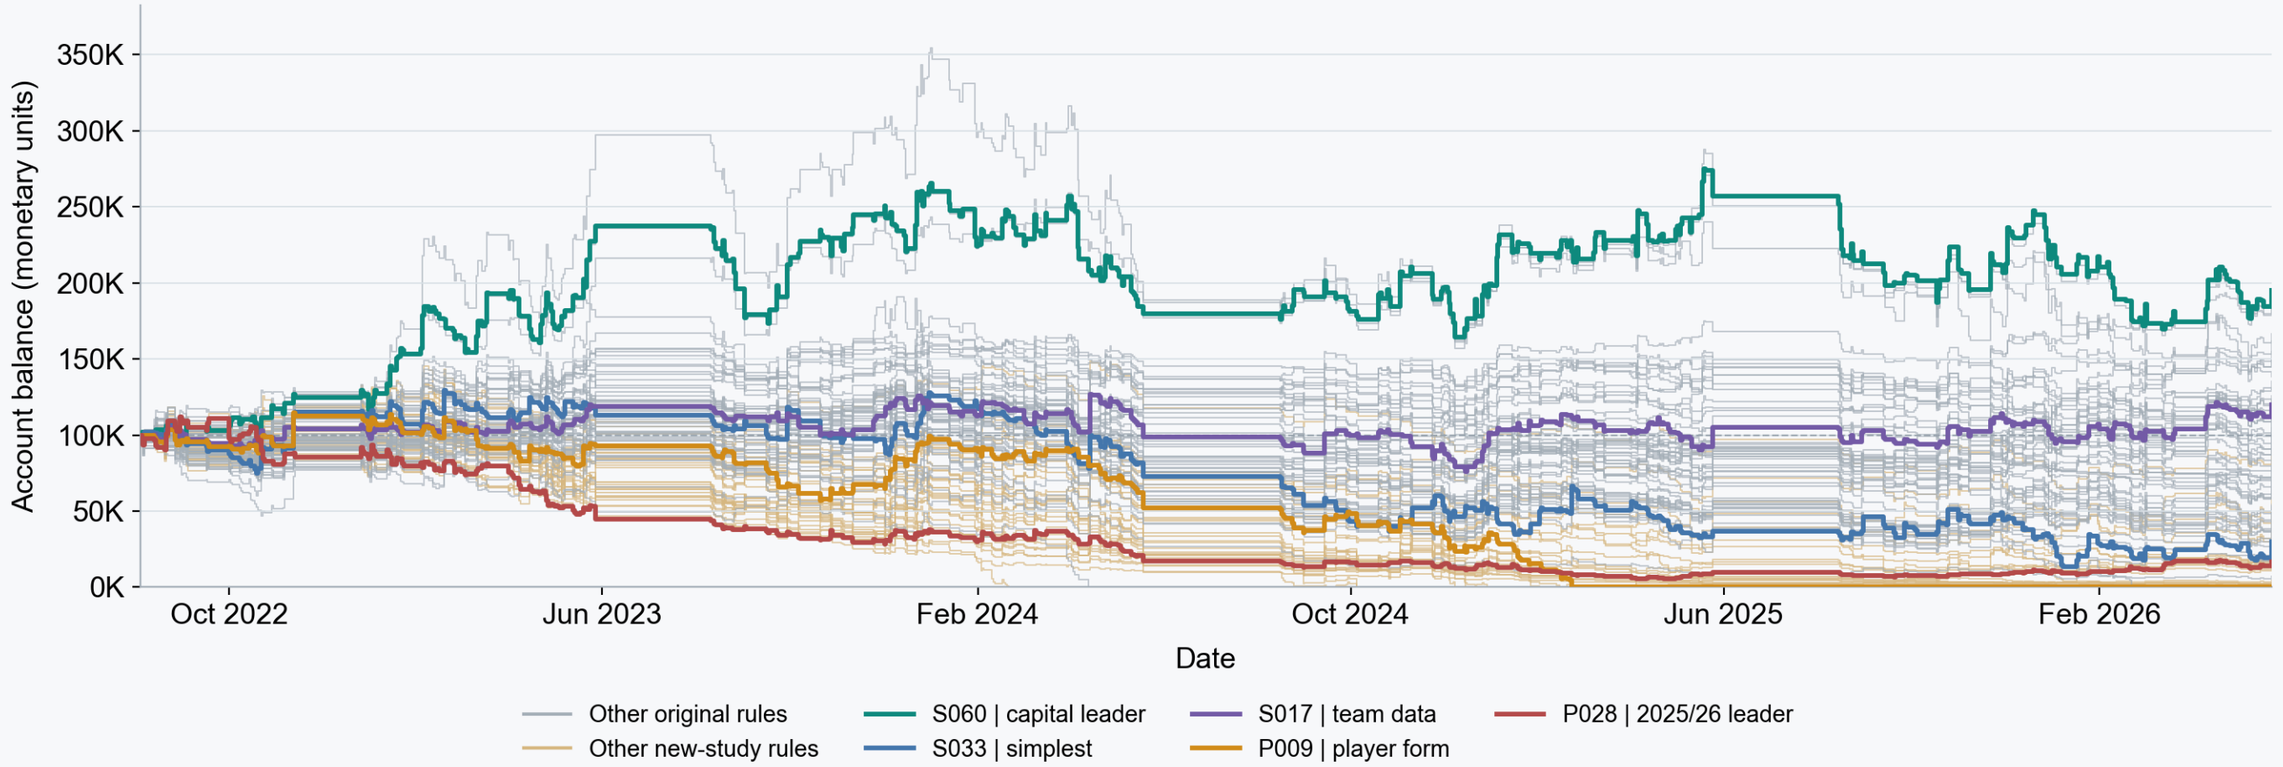

Open interactive HTML

Sources: graph_equity_2025_all.csv | Full paths in notes

Money progression: all 88 comparable accounts

2022/23–2025/26 | Same 1,470 fixtures | Continuous cash with no annual resets

24 profitable / 64 losing / 13 reach zero

The 28 first-study rules without comparable earlier predictions are excluded from the four-year chart.

Open interactive HTML

Sources: graph_equity_continuous_all.csv | Full paths in notes

Highest four-season ending capital: S060

A historical capital leader, selected descriptively after comparing the 88 compatible accounts.

ENDING ACCOUNT

195,190

Initial 100,000

PROFIT

95,190

Four seasons without deposits

RETURN ON STARTING CASH

95.19%

Not the ROI on turnover

Market-residual model with team, xG and FPL inputs.
Choose maximum edge above 5%.
Quarter Kelly; 2% per-bet cap.
10% date-level cash budget; best archived quotes.

Trading statistic	Recorded result
Bets / priced fixtures	1,186 / 1,470
Hit ratio / trading frequency	30.69% / 80.68%
Expected gain / loss per trade	2226.45 / 1652.54
Realized winning gain / losing loss	5973.63 / 2529.45
ROI on total stakes	2.99%
Maximum drawdown	38.35%

Its recorded ROI confidence interval crosses zero. The historical ranking does not select a validated live policy.

Sources: metrics.parquet; metrics_continuous.parquet; metrics_single.parquet | Full paths in notes

A one-season winner can fail over four seasons

P028: team + full player block, logistic regression, Bet365 reference prices, quarter Kelly capped at 2% per bet.

2025/26 ENDING ACCOUNT

167,925

67.93% return on starting cash

CONTINUOUS FOUR-SEASON ACCOUNT

16,675

-83.33% return on starting cash

Scope	Bets	Hit ratio	Trade frequency	Stake ROI	Max drawdown
2025/26	345	28.70%	92.25%	10.62%	32.79%
Continuous four seasons	1328	26.58%	90.34%	-10.67%	95.18%

The model's pooled accuracy is 50.95% and log loss is 1.0161. A profitable slice does not establish better forecasting.

Sources: metrics_single.parquet; metrics_continuous.parquet; model_metrics_pooled.parquet | Full paths in notes

The same-scope trading scorecard

All rows: continuous four seasons, 1,470 priced opportunities, one initial 100,000 account.

Strategy / role	Final money	Hit ratio	Trade freq.	Expected gain / trade	Expected loss / trade	Stake ROI	Max DD
S029 | Best learned predictor	123,340	31.04%	78.03%	852.95	663.70	2.03%	31.88%
S033 | Simplest predictor	29,760	23.01%	98.44%	1739.52	611.96	-4.85%	89.49%
S017 | Team data	119,790	29.57%	84.42%	962.54	648.43	1.59%	40.35%
P009 | Player form	0	25.00%	64.22%	1098.04	618.22	-10.87%	100.00%
S060 | 4-year capital leader	195,190	30.69%	80.68%	2226.45	1652.54	2.99%	38.35%
P028 | 2025 capital leader	16,675	26.58%	90.34%	628.17	356.67	-10.67%	95.18%

Expected gain/loss use the model's probabilities and the recorded stakes. They are not average realized wins/losses.
Full observed payoffs, uncertainty and all 116 / 88 account metrics are in the companion workbook.

Sources: metrics.parquet; metrics_continuous.parquet; metrics_single.parquet | Full paths in notes

Historical profit depends on prices and path assumptions

S060 illustrates why a quote replay and a payout-only repricing answer different questions.

ORIGINAL BEST-QUOTE PROFIT

95,190

Saved choices and cash path

BET365 POLICY REPLAY PROFIT

55,952

Recompute selection and sizing

FIXED-EXPOSURE REPRICING

-30,549

Keep original bets/stakes; change payouts

Best quotes may come from different books.
Capture clocks and availability are unverified.
No stake limits or observed transaction costs are modeled.

Selections and sizing react to odds.
Cash exposure changes the later path.
Whole-date bootstrap intervals do not remove model or strategy selection uncertainty.

These archived-price paths do not demonstrate executable fills, arbitrage or prospective investment returns.

Sources: metrics_continuous.parquet; quote_summary.json; PROTOCOL.md | Full paths in notes

A prospective pipeline exists; trading P&L does not

Status of the saved 20 October snapshot. October 23–25 targets have not been scored in this presentation.

RESOLVED FIXTURES

10

40 predictions from four frozen models

NEXT COHORT

120 pending

40 earlier-model + 80 new-model forecasts

RECORDED PROSPECTIVE TRADES

0

No valid pre-kickoff quote/stake ledger

All four earlier models scored 6 / 10.
60% accuracy; 95% Wilson interval: 31.27%–83.18%.
No winner was selected.

All 120 pending predictions refer to the same ten upcoming fixtures.
The reviewed export copies the same 80 new-model records; it adds no forecasts.

Hash-chained records retain creation times, inputs and model hashes. Missing prices mean no prospective ROI or wealth graph.

Sources: prospective_status.json; model_scores.csv; forecast_release.json | Full paths in notes

What the implemented results support

A reproducible research and forecasting system, with clear negative as well as positive findings.

PREDICTION

Market baseline

Lowest pooled log loss and Brier

PLAYER EXPANSION

No improvement

All six variants trail matched controls

TRADING

Leaders differ

Probability loss and capital are distinct

The next valid evidence is already defined

Evaluate the fixed pending forecast cohorts as their results arrive.
Capture valid pre-kickoff quotes before assessing prospective trading.
Preserve losing variants and the original information boundaries.

The following slides are backup material: metric definitions, provenance and the complete 116-strategy catalog.

Sources: independent_audit.json; ABLATION_RESULTS.md | Full paths in notes

Backup | metric definitions

All money values are generic monetary units. Cash accounts have no deposits or borrowing.

Metric	Definition / denominator
Prediction accuracy	Correct most-likely H/D/A classifications / evaluated matches
Hit ratio	Winning settled bets / all settled bets
Trade frequency	Actual placed bets / common priced fixture opportunities
Model expected gain per trade	Mean of p × stake × (decimal odds − 1) over placed bets
Model expected loss per trade	Mean of (1 − p) × stake over placed bets
Observed win / loss means	Average net winning payoff / average losing stake, conditional on outcome
Stake ROI / capital return	Net profit / turnover; net profit / initial 100,000
Maximum drawdown	Largest peak-to-trough proportional decline in the account path

Sources: METHODOLOGY.md; metrics.py | Full paths in notes

Backup | provenance and reproducibility

All displayed numerical results come from saved project artifacts; this presentation fits no models and places no trades.

Artifact block	What to inspect
epl_modeling/ablation_results	Earlier rolling predictions, 11 variants and fitted models
epl_player_models/results/20261020_player_models_review	New model comparisons, all-116 / all-88 graph data, detailed accounts
epl_strategy_validation / epl_execution	Continuous cash replays, selection audit and quote sensitivity
epl_prospective/results/20261020_first_outcomes	First ten-game prospective evaluation and source cross-checks
